

Sapphire Composite Research Note

2026-04-29 | BTC | local sweep and paper-performance evidence

Rank metric	Return	Win rate	Trades	Drawdown
1.42	18.5	0.62	18	-0.08

Thesis

Sapphire Composite is ready for research-note packaging because the latest local sweep identifies BTC as the clearest candidate, ranked by sortino=1.42. The live trading conclusion is intentionally absent: this memo is an auditable research artifact for evaluating whether the strategy evidence is coherent enough for operator review.

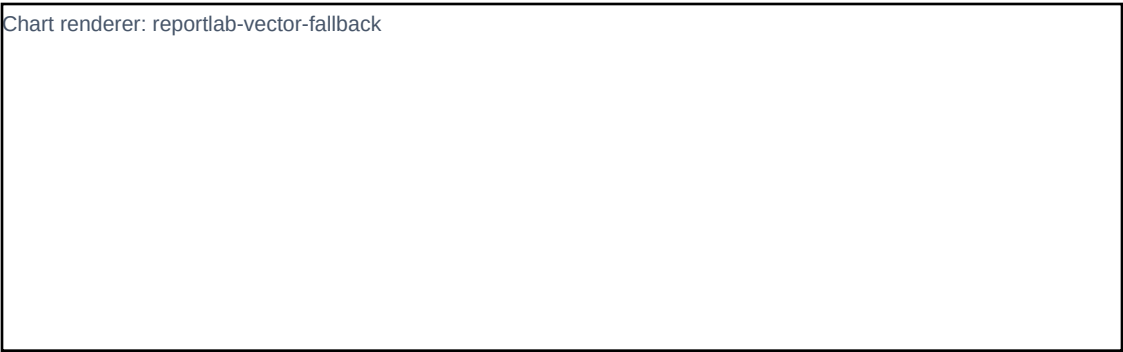

Counter-Thesis

The counter-thesis is that a sweep leader can be overfit, stale, or supported by too few closed trades. A buyer should treat this as evidence of process maturity, not proof that future market returns will resemble the historical sample.

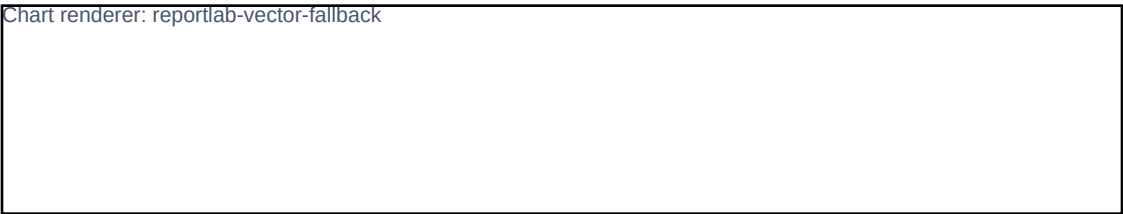

Evidence

- Backtest coverage: 144 local strategy evaluations.
- Leaderboard filter retained 7 rows from 12 candidates.
- Observed performance stream contains 18 closed trades and \$1,840 total PnL.
- Top row reports total_return=18.5% and win_rate=62.0%.
- Context regime tag: fixture.

Equity Context

Drawdown Context

Invalidators

- Invalidate the note if the next completed sweep changes the top strategy or symbol.
- Invalidate if the retained leaderboard row count falls below the configured minimum-trade filter.
- Invalidate if realized closed-trade performance diverges from the sweep direction over the next review window.
- Invalidate if source artifacts are missing a provenance envelope or cannot be reproduced locally.

Next Steps

- Compare the next sweep against this note before changing any operator-facing recommendation.
- Attach this PDF and its envelope to the diligence packet only with the research-only caveat intact.
- Keep execution, sizing, Telegram delivery, and customer data out of this pipeline.

Safety Caveat

Research-only artifact. This note does not place trades, size positions, send Telegram messages, include customer data, or authorize live execution.
